🎬 SalesPOC – Video Transcript

Hello, my name is Michael Yaacoub, and this is SalesPOC — my end-to-end enterprise sales intelligence solution built for the Microsoft Copilot SDK Challenge.

This solution demonstrates how governed APIs, MCP servers, Azure AI Foundry agents, and Copilot SDK integration can transform traditional sales dashboards into an AI-native sales execution platform.

🎯 Business Problem

Enterprise sales teams struggle with:

- Fragmented data across systems
- Manual deal analysis
- Inconsistent strategy preparation
- Limited executive visibility
- Slow follow-up cycles

Sales leaders want strategic insights.
Sales strategy teams want structured deal analysis.
Account owners want actionable recommendations.

SalesPOC solves all three.

👥 User Personas

1️⃣ Sales Managers & Executives

They use SalesPOC to:

- Monitor sales by Product, Region, and Customer
- Track KPIs and trends
- Identify risk concentration
- Access AI-generated executive summaries

This gives leadership real-time visibility with AI-enhanced insights.

2️⃣ Sales Strategy Team

This is where Copilot truly transforms the workflow.

The Sales Strategy Team opens a customer account, and the **Deal Strategy Copilot automatically analyzes the account context**.

It returns structured output:

- Risk Assessment
- Cross-Sell Opportunities
- Recommended Actions
- Executive Summary

From there, the team can:

- Draft contextual follow-up emails
- Export a professional strategy report
- Send the strategy to the Account Owner

What used to take hours of spreadsheet analysis now happens in seconds — structured, repeatable, and AI-assisted.

3️⃣ Sales Representatives (Account Owners)

Account owners receive:

- AI-prepared strategy
- Actionable next steps
- Pre-drafted customer emails
- Data-driven insights

They can also use the **AI Sales Chat Assistant** to:

- Ask natural language questions
- Generate charts
- Retrieve product documentation
- Combine insights across multiple data sources

This improves execution speed and deal positioning.

🖥️ Experience

The application is built with Angular and Ionic, making it fully responsive across:

- Web
- iOS
- Android

Same codebase. Enterprise-ready UX.

📐 Architecture Overview

Now let's look at how this is built.

🔹 Data Layer

The solution integrates multiple enterprise data sources:

- Azure SQL Database for customers, products, orders, and sales facts
- Azure Cosmos DB for product metadata
- Azure Blob Storage for datasheets and marketing documents

This ensures AI grounding across structured and unstructured data.

🔹 API Layer

We expose secure REST APIs across Dev, Test, and Prod environments.

These APIs are fronted by Azure API Management for:

- Security
- Versioning
- Policy enforcement
- Observability

Most importantly:

The same APIs are exposed as **MCP servers**, allowing AI agents to securely call enterprise tools.

🔹 API Governance

Using Azure API Center, we implemented:

- Central API catalog
- Custom rulesets
- Separate validation profiles for REST and MCP

This ensures enterprise-grade governance for both traditional APIs and AI-native interfaces.

🔹 AI Layer – Azure AI Foundry

Inside Azure AI Foundry, we created two agents:

1️⃣ Sales-Agent
Used for chat assistant analytics and multi-source reasoning.

2️⃣ Deal Strategy Agent
Used for structured account-level strategy output.

Backend APIs leverage the Copilot SDK to:

- Send grounded prompts
- Enforce structured JSON responses
- Return deterministic outputs

This ensures the UI renders predictable strategy cards — not unstructured AI text.

🔹 Frontend

The frontend consumes structured results and renders:

- Risk cards
- Cross-sell cards
- Action lists
- Executive summaries
- Drafted emails

The result is an AI-native workflow, not just a chatbot.

🚀 DevOps & Automation

This solution is fully modular and automated across multiple repositories:

- UI
- APIs
- Database
- MCP Servers
- API Management
- API Center
- AI Foundry Agents

GitHub Actions handle:

- Build
- Test
- Deployment
- Azure provisioning

PowerShell automation scripts deploy:

- App Services
- SQL
- Cosmos
- Storage
- APIM
- API Center rulesets
- MCP servers
- AI agents

The entire environment is reproducible and enterprise-ready.

🏢 Enterprise Validation

This solution has already been demonstrated in enterprise workshops.

With SanDisk, during a 3-hour Azure deployment session with over 40 attendees, feedback included:

“This was very helpful and we truly appreciate your support and partnership.”

With Arrow Electronics, after an API Center and ruleset deep dive, feedback highlighted:

“Thank you for the great effort… the sample scenarios were very thorough.”

These engagements validate the architectural depth and enterprise relevance.

🎯 Why This Matters

SalesPOC is not just a demo.

It demonstrates how enterprises can:

- Combine governed APIs and AI
- Expose REST and MCP in parallel
- Use Copilot SDK for structured enterprise workflows
- Deliver cross-platform AI-native applications
- Maintain governance and operational readiness

This is a blueprint for enterprise AI transformation.

Thank you.
